

TAKE-OFF[®] DRENCH

TAKE-OFF DRENCH is a comprehensive blend of water-soluble ingredients formulated and manufactured by Dawe's Laboratories to improve fresh cow health and performance.

Just one pound of **TAKE-OFF DRENCH** mixed with 5 gallons of warm water provides for each cow:

- ◆ **Calcium propionate** – 8 oz. per pound helps to increase blood calcium and prevent ketosis in fresh cows.
- ◆ **Sodium and potassium buffers** – to supply electrolytes and maintain optimum rumen pH, while also increasing DCAD for improved metabolism.
- ◆ **Magnesium sulfate** – helps to maintain proper function of nerves and muscle tissue.
- ◆ **Glucose and starch** – to supply needed energy and spark ruminal fermentation.
- ◆ **Degradable proteins, peptides and amino acids** – to enhance rumen bacterial growth and metabolism.
- ◆ **Yeast culture** - 100 billion colony-forming units (C.F.U.) of Saccharomyces cerevisiae improves intake, digestive efficiency, and rumen buffering.
- ◆ **Direct-fed microbials** - 5 billion C.F.U. of lactic acid-producing bacteria in each dose helps to maintain normal gut flora and keep out harmful bacteria for improved health and greater intakes.
- ◆ **Vitamins and trace minerals** - Maintain metabolism and boost immune function, helping the cow resist infection and disease during stress. **TAKE-OFF DRENCH** provides 150,000 I.U. of Vitamin A, 50,000 I.U. Vitamin D3, 1000 I.U. Vitamin E, along with B-vitamins and trace minerals in each pound.

TAKE-OFF DRENCH can be administered via an esophageal pump, gravity flow system, or the drinking water of fresh and off-feed cows.

TAKE-OFF DRENCH is available in 20 lb. and 40 lb. pails. For more information on **TAKE-OFF DRENCH** contact your Dawe's representative or call 800-323-4317.
